Treatment of choroidal detachment CSL, OPTHAL. 1955, 11/2
(107-109)

If the detachment is a sequel of cataract extraction conservative treatment is recommended, active treatment being indicated only after some months' duration or in repeated recurrences. Cauterization of the operating scar with subsequent covering by conjunctival flap is recommended even in those cases where filtration into the conjunctival sac cannot be proved clinically. In choroidal detachment following fistulizing antiglaucomatous operations a conservative course is indicated only when partial formation of the anterior chamber occurs within 7 days after operation. When this fails, posterior sclerotomy is indicated, preferably with a 2 mm. trephine. Report on 2 cases. Zahn - Prague

TITLE: Separation of rare earth elements by the continuous electrophoresis method

SOURCE: AN SSSR, Institut geokhimii i analiticheskoy khimii. Sovremennyye metody analiza; metody issledovaniya khimicheskogo sostava i stroyeniya veshchestv (Modern methods of analysis; methods of investigating the chemical composition and structure of substances), 222-224

TOPIC TAGS: rare earth element, electrophoresis, isotope separation, radioactive isotope, CHROMATOGRAPHY

ABSTRACT: The published literature describes several methods of separating rare earth elements by continuous electrophoretic and electrochromatographic methods, but none of these methods provides means of separating the short-lived isotopes. The authors indicated elsewhere that in theory it is possible to perform the separation of rare earth elements by electrophoresis on paper in a few minutes. The present work attempts to apply the methods of continuous electrophoresis.

TITLE: The Performance of a 330 Mill at the Kuybyshev Plant in Kramatorsk (Opyt raboty stana 330 Kramatorskogo metallurgicheskogo zavoda im. Kuybysheva)

PERIODICAL: Tr. Nauchno-tekhn. o-va chernoy metallurgii, 1956, Vol 10, pp 424-427

ABSTRACT: A detailed account is given of the performance of a 330 mill which was put in operation in 1951. A two-row three-chamber holding furnace with an output capacity of 25 tons/hr, functioning on blast-furnace gas, heated the air to 650°, the gas to 350°. The mill's blooming line had two operating 3-roll 550 stands, the effective roll width being 1650 mm; the motor was of 750 kw. The mill's finishing line consisted of five twin two-high finishing stands 330. The power unit was an 1100-kw asynchronous motor directly connected to a 4-roll gear stand. The billet was passed along by conveyor equipment. A mechanized cooling rack 42 meters long was set up beyond the mill. Three rolling-press workers were employed on the finishing

The Performance of a 330 Mill at the (cont.)

line. The performance characteristics of the various types of mill, rolling procedures, and an appraisal of roll performance are included. An account is given of improvements made on the mill since it first started operating. In three years its output capacity was upped 35 percent. A narrow area had been set aside for ingot storage and the cold-cutting shears. See Ref. zhur. Met., 1957, Nr 12, abstract 22805.

TITLE: Use of complexon III, in the radiometric determination of metal traces by means of electrophoresis

SOURCE: Zhurnal analiticheskoy khimii, v. 20, no. 11, 1965, 1160-1163

TOPIC TAGS: yttrium, europium, trace analysis, electrophoresis, radiometry, radioisotope

ABSTRACT: Experiments were carried out on traces of radioyttrium (Y^{91}) and europium in order to demonstrate the applicability of complexon III to the determination of traces of radioactive and inactive isotopes by means of electrophoresis. Complexon III was added to the yttrium salt in acetate buffer solutions and subjected to electrophoresis. The results showed that radioactive yttrium could be determined in amounts as low as 10^{-10} g/ul. The sensitivity of the proposed method far exceeds that of chemical methods for determining traces and approaches the sensitivity of activation analysis. The method is simple and rapid and can be used for the determination of all metals forming stable, negatively charged complexes with complexon III. The method is of particular importance in the determination of the carrier content in

TITLE: Ultrasonic study of the anisotropy of barium titanate ceramics

SOURCE: Conference on Acoustics of Solid Media. Warsaw, 1964. Proceedings. Warsaw, PWN, 1966, 127-130

TOPIC TAGS: barium titanate, ceramic material, ultrasonic velocity

ABSTRACT: In order to determine the elastic properties of barium titanate ceramics, the velocities of longitudinal ultrasonic waves were measured at 19°C as functions of the voltage of the applied electric field. The anisotropy of the elastic parameters caused by the pressing during the preparation of the barium titanate plates could be observed even after the firing. The anisotropy coefficient changes between 0.98 and 1.04 under the influence of the outer electric field. With the exception of the curve of initial polarisation, the dependence of anisotropy on the voltage of the outer electric field is symmetrical and has a hysteresis-type character. Orig. art. has: 4 figures and 2 tables.

Test results over the potential of cathode-protected
experimental steel sheet-piling sections, by connecting
them to an outside source of electric current.
Description of measurements taken and of results
obtained in the ports of Gdansk and Gdynia. It
was found necessary to examine such further parameters
as are essential for designing cathodic means
of protection. The article deals, moreover, with
the theoretical principles of this particular
method of protecting steel from corrosion.

Title : Synthesis of arylstibine acids from binary diazonium salts of antimony pentachloride

Periodical : Izv. AN SSSR, Otd. Khim. Nauk., 3, 410 - 417, May - June 1954

Abstract : The formation of arylstibine acids, resulting from the decomposition of binary diazonium salts of antimony pentachloride with cuprous chloride in a medium of organic solvents, was investigated. The homolytical, but not a free-radical nature of the reaction leading to the formation of arylstibine acids, was established by the nature of the secondary reaction products. The three stages bringing about the formation of arylstibine acid are described. Nine references: 6 USSR, 2 German, 1 USA. Tables.
